Outstanding features of the tractor-towed stabilizer

1|

HEAVY-DUTY LINKAGE

> Reliable transmission of power

Heavy-duty shaft drive for reliable transmission of the engine power to the milling and mixing rotor by means of an overload clutch.

> Three-point hitch

Standardized three-point hitch tailored to field requirements.

> Easy attachment

Attachment to the tractor is completed quickly in a few simple steps.

EFFICIENT MILLING AND MIXING PERFORMANCE

> Powerful milling and mixing rotor

Powerful milling and mixing rotor available with different toolholder systems.

> Mechanical drive

Highly efficient mechanical belt drives on the left and right.

> Eccentric milling rotor gearbox

Pulley housing always remains above the ground due to eccentric milling drum gearbox.

> Quick replacement of cutting tools Easy replacement of cutting tools using a pneumatic tool extractor.

1 | The reliable drive concept ensures high efficiency and significantly reduces fuel consumption.

Boost up your tractor to become a soil stabilizer

MAKING A SUCCESSFUL START IN SOIL STABILIZATION

Soil stabilization has been proving its worth for many decades as an economical and environmentally friendly method. The WS 220 and WS 250 tractor-towed stabilizer from WIRTGEN enables you to turn your tractor into a perfect soil stabilizer with only a few simple flicks of the wrist.

The compact unit converts instable ground into high-quality construction material, improves

compactability, and dispenses with the necessity of an expensive soil exchange. It impresses with its intelligent design and highly economical operation. The unit's low weight and compact dimensions facilitate transport from one construction site to the next.

Because of the low capital expenditure involved, the combination of towed stabilizer and tractor is ideally suited in particular for small to medium-sized construction projects.

2 Flawless mixing results and perfect leveling are the hallmarks of the tractor-towed stabilizer.

1 | The standardized three-point hitch complies with common international standards.

Hooked up quickly and easily

SIMPLE MOUNTING PRINCIPLE

It happens every day: the tractor, used as a towing unit just a minute ago, needs to be converted into a soil stabilizer as quickly as possible. This requirement necessitates a simple yet practical attachment system for the milling and mixing rotor unit.

Being geared to flexible and effective operation, the tractor-towed stabilizer from WIRTGEN offers the ideal solution. It is attached to the tractor effortlessly by means of a standardized three-point hitch, using the tractor's shaft drive at the same time to drive the milling and mixing rotor.

2 | Hook up via three-point hitch, attach top link ...

3 | ...connect driveshaft, and here goes!

Variable stone guard

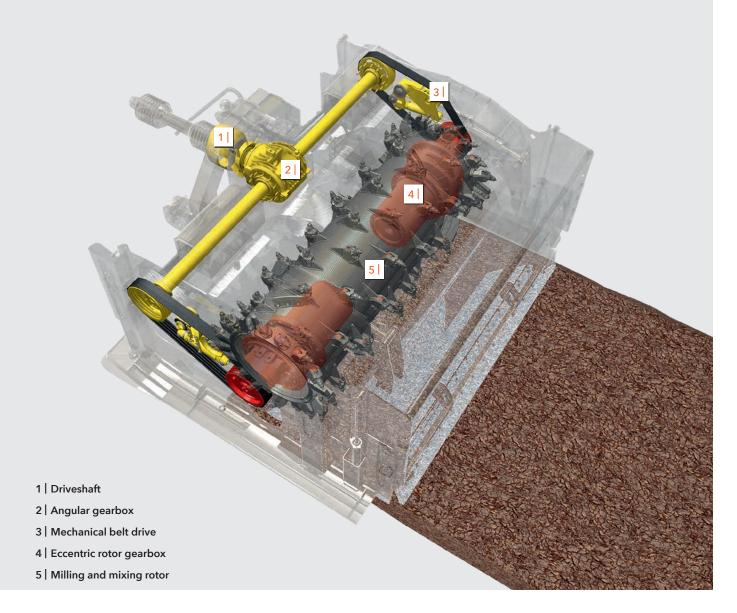

PROTECTION AGAINST FLYING STONES

The rotor housing is additionally equipped with a variable stone guard at the front. The stone guard protects against flying stones and

reduces the development of dust. The unit is adjustable in height hydraulically and can be adapted to site conditions.

- 1 2 | The stone guard consists of fatigue-resistant hard rubber and can be adjusted to the stabilizer's current working depth.
- 3 The stone guard is proving its worth in operation: no flying stones and less dust.

Efficient mechanical belt drive

TRANSLATING POWER INTO PRODUCTIVITY

The success of our tractor-towed stabilizers is guaranteed by their ability to thoroughly mix even the heaviest soils. This is ensured by the powerful, mechanically driven milling and mixing rotor, which homogenizes the material effectively across the full working width and evenly mixes in the pre-spread binding agents, such as lime or cement. Belt drives are arranged on both sides of the milling and mixing rotor.

This dual drive concept is very efficient in translating engine power into milling performance. In addition, the eccentric rotor gearbox causes the pulley housing to always remain above the ground.

The stabilizer's intelligent drive concept has the positive side effect of reducing the tractor's fuel consumption. The spring-loaded belt tensioner ensures optimum transmission of power at all times.

1 | Powerful belt drive for full power at working depths of up to 20 in (500 mm).

Lots of know-how in the milling and mixing rotor

GEARED FOR TOUGH OPERATIONS

1 Ample storage space for tools or wearing parts.

The milling and mixing rotor - core element of the tractor-towed stabilizer - can optionally be equipped with the tried-and-tested quick-change toolholder system **HT22** for tough everyday operation on the construction site. With

this system, WIRTGEN builds on its experience of many years in cutting technology. A precisely defined arrangement of the cutting tools on the rotor ensures smooth machine behaviour and perfect milling and mixing results. Additional marks in favour of this system are optimum tool rotation, extremely low wear and tear, easy tool replacement, and easy monitoring of the degree of wear of the upper toolholder parts. The intelligently arranged toolholders allow sufficient space for the material to be stabilized. The mode of operation minimizes material stress, which extends the useful life and improves the profitability of the entire machine. The pneumatic tool extractor and easily accessible rotor enable cutting tools to be replaced quickly and conveniently.

- 2 | The quick-change toolholder system HT22 significantly reduces operating costs of the machine.
- 3 | The innovative WIRTGEN WCC flat picks offering exceptional durability and high fracture strength can also be used at the customer's request.
- 4 | Basic model with welded toolholders.

1 | The milling and mixing rotor is the only part penetrating the soil. The current milling depth can be monitored on a digital milling depth indicator.

Side plates moving on skids prevent performance losses

EXCELLENT PERFORMANCE CHARACTERISTICS

Height-adjustable side plates enable only the milling and mixing rotor to penetrate the soil down to the specified working depth right from the start. The intelligent design prevents the side plates from sapping power needlessly as a result of being pulled through the recycled material. The power provided by the tractor is used entirely to drive the milling and mixing rotor. If required, the operator can raise the side plates via hydraulic cylinders. The current working depth can be monitored conveniently from the tractor's cab at all times via the digital milling depth indicator.

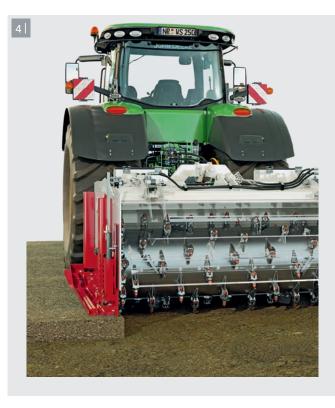

Side plates comprising a mechanical retainer can be installed at the tractor-towed stabilizer at the customer's request. The retainers can be adjusted manually and ensure compliance with the specified working depth. In this design, the three-point hitch of the tractor is in floating position, and the tractor-towed stabilizer moves on the skids. A typical example of use is the stabilization of agricultural roads at a consistent working depth of 10 in (25 cm).

- 2 Combined with a mechanical retainer, the side plates guarantee a consistent working depth.
- 3 The hydraulically height-adjustable side plates allow the milling and mixing rotor to penetrate the soil immediately.
- 4 The lifting side plates move over the surface on skids regardless of the working depth.

Homogeneous mixing quality guaranteed

ADJUSTABLE ROTOR PLATE

1 - 2 | The rotor plate can be precisely adjusted to requirements.

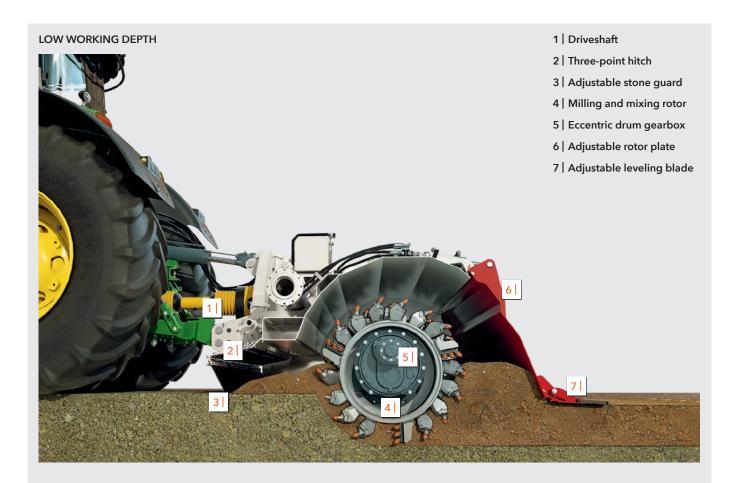

The WS 220 and WS 250 tractor-towed stabilizers from WIRTGEN are the most powerful stabilizers in their class. This is attributable, to a significant extent, to the mixing chamber which has been designed in line with field requirements and greatly contributes to the homo-

geneous mixing of binders and soil. The rotor housing design and high position of the rotor plate have been perfectly tailored to the powerful milling and mixing rotor. Hydraulic cylinders and springs at the rear rotor plate ensure optimum contact pressure. These features ensure an optimum quantity of construction material in the mixing chamber at all times and also create an even surface behind the tractor-towed stabilizer.

WIRTGEN stabilizers are the ideal candidates also for homogenizing soils averse to compaction, such as non-uniform soil mixtures.

HIGH WORKING DEPTH

Finishing with a perfect surface

PERFECT FINISH

Following thorough mixing, the soil is levelled across the full width by the permanently pre-tensioned rotor plate which is fitted with an adjustable leveling blade. This design ensures that an optimum quantity of construction material mix is in the mixing chamber at all times, and additionally creates an even surface behind the tractor-towed stabilizer. The working depth is set via the tractor's rear power lift. Powerful hydraulic cylinders and springs with high spring rate ensure steady contact pressure at the rear

rotor plate. Depending on the working depth and type of soil to be stabilized, the angle of the leveling blade to the rotor plate can additionally be adjusted manually to ensure optimum distribution of the material at all times.

After compaction by suitable rollers, the stabilized soil meets the specified quality standards.

1 The combination of rotor plate with spring assembly and adjustable leveling blade guarantees optimum results.

2 Adjustment of the leveling blade is effected mechanically via slotted holes.

3 Long spring assemblies ensure optimum contact pressure of the rotor plate.

1 | Soil improvement using lime reduces the water content in excessively moist or wet soil ...

2 ... in order to

compactability.

improve its

Soil improvement - producing soil suitable for compaction

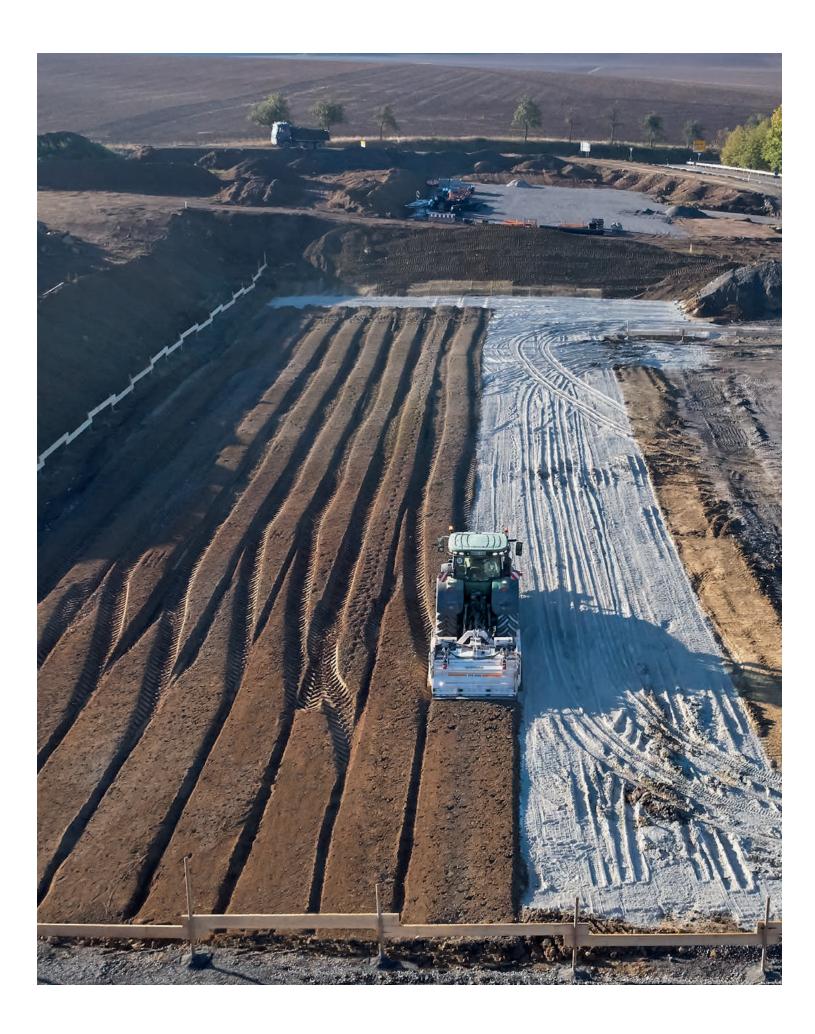

FOR BETTER QUALITY

Whether heavy, coarse-grained or sandy subgrade material: the tractor-towed stabilizer can be relied on to convert it into soil that is highly suitable for placing and compacting.

If too coarse, the material to be stabilized is crushed in the mixing chamber by the milling and mixing rotor. Soft soil is covered with lime spread by, for instance, a binder spreader prior to treatment. Subsequent homogeneous mixing by the milling and mixing rotor causes the lime to remove the excess humidity from the soil.

In earthmoving operations, soil improvement pays off in the construction of, for instance, dams or embankments, backfilling or site haulage roads. Soil improvement has shown itself to be eminently suitable also for landfills with clayey subsoils. Soil processed with suitable binding agents is practically unsusceptible to water and offers optimum conditions for further compaction.

1 | Binder spreaders from Streumaster are perfectly suited to work in tandem with our soil stabilizers.

Soil stabilization - a foundation to build on

2 | In soil strengthening, permanently load-bearing soil is produced in the mixing chamber.

GROUNDWORK FOR HEAVY LOADS

Soil stabilization with added binding agents like cement is a patent remedy for increasing the long-term resistance against stresses resulting

from traffic and weather conditions. The cement is pre-spread by, for instance, a binder spreader and is then thoroughly mixed with the soil by the milling and mixing rotor. Soil stabilization produces a ground of permanently high bearing capacity, strength and excellent resistance to frost.

Soil stabilization guarantees a permanently high degree of volume stability. Analyses and samples taken on site confirm that the specified targets have been met.

The stabilized surfaces are ideally suited for the construction of parking lots, roads, sports grounds, track beds, harbour docks, airfields and industrial facilities.

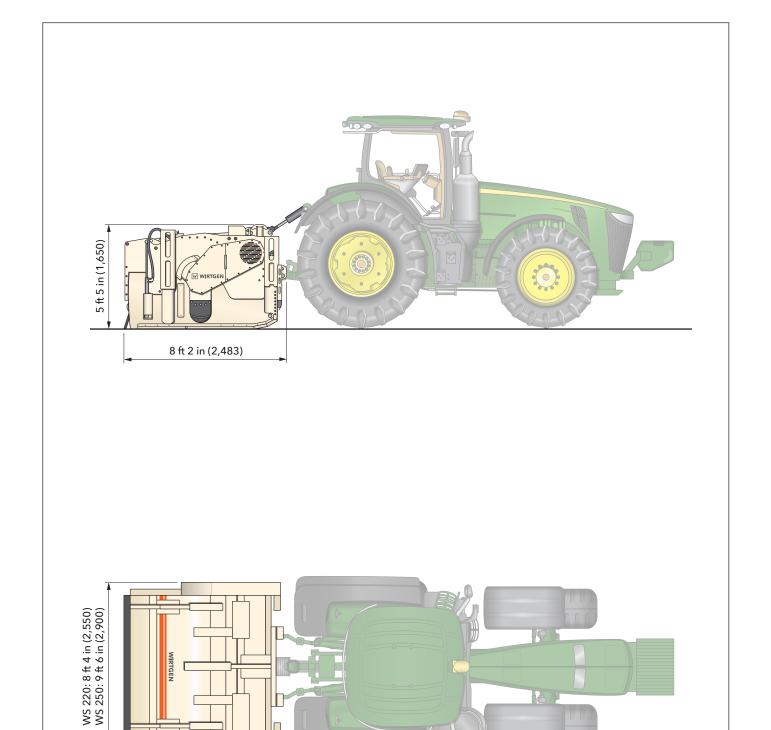

Technical specification

| | WS 220 | WS 250 | |
|---|--|---|--|
| Milling and mixing rotor | | | |
| Working width max. | 7 ft 1 in (2,150 mm) | 8 ft 2 in (2,500 mm) | |
| Working depth | 0 to 20 in (0 to 500 mm) | | |
| Tool spacing | HT9: 1.4 in (35 mm) / HT22: 1.6 in (40 mm) | | |
| Number of cutting tools with toolholder system HT9 | 88 | 98 | |
| Number of cutting tools with toolholder system HT22 | 98 | 106 | |
| Drum diameter with tools | 3 ft 7 in (1,080 mm) | | |
| Drum speed | 210 rpm | | |
| Transport dimensions | | | |
| Dimensions (L x W x H) | 8 ft 2 in x 8 ft 4 in x 5 ft 5 in (2,483 x 2,550 x 1,650 mm) | 8 ft 2 in x 9 ft 6 in x 5 ft 5 in (2,483 x 2,900 x 1,650 mm) | |
| Tractor requirements | | | |
| Recommended engine power | > 180 kW / 245 PS | > 220 kW / 300 PS | |
| Recommended traction drive | continuously variable 0 to $v_{\mbox{\scriptsize max}}$ | | |
| Max. output at the driveshaft | 280 kW / 381 PS | | |
| Loading weight, front | 5,512 to 6,614 lbs (2,500 to 3,000 kg) (3,968 lbs (1,800 kg) for John Deere 8R series) | | |
| Driveshaft | with internal toothing 1 ³/₄", 20 or 6 teeth* | | |
| Driveshaft speed | 1,000 rpm | | |
| Rear power lift | three-point, categories 3 and 4 DIN / ISO 730-1 | | |
| Additional rear valves one each, double-acting | | | |
| For rear drum plate | yes | | |
| For stone guard, front | yes | | |
| For hydraulic top link (optional) | yes | | |
| Including floating position for side plate, left and right | yes | | |
| Machine weights | | | |
| Own weight with HT9 toolholder system | 9,910 to 10,461 lbs (4,495 to 4,745 kg) | 10,483 to 11,034 lbs (4,755 to 5,005 kg) | |
| Own weight with HT22 quick-change toolholder system (option) | 9,965 to 10,670 lbs (4,520 to 4,840 kg) | 10,648 to 11,376 lbs (4,830 to 5,160 kg) | |

^{* =} Driveshaft needs to be dimensioned in accordance with the tractor's engine power (length depending on equipment combination)
